Psychological Testing in the Service of Disability Determination Institute of Medicine, Board on the Health of Select Populations, Committee on Psychological Testing, Including Validity Testing, for Social Security Administration Disability Determinations, 2015-06-29 The United States Social Security Administration (SSA) administers two disability programs: Social Security Disability Insurance (SSDI), for disabled individuals, and their dependent family members, who have worked and contributed to the Social Security trust funds, and Supplemental Security Income (SSI), which is a means-tested program based on income and financial assets for adults aged 65 years or older and disabled adults and children. Both programs require that claimants have a disability and meet specific medical criteria in order to qualify for benefits. SSA establishes the presence of a medically-determined impairment in individuals with mental disorders other than intellectual disability through the use of standard diagnostic criteria, which include symptoms and signs. These impairments are established largely on reports of signs and symptoms of impairment and functional limitation. Psychological Testing in the Service of Disability Determination considers the use of psychological tests in evaluating disability claims submitted to the

SSA. This report critically reviews selected psychological tests, including symptom validity tests, that could contribute to SSA disability determinations. The report discusses the possible uses of such tests and their contribution to disability determinations. Psychological Testing in the Service of Disability Determination discusses testing norms, qualifications for administration of tests, administration of tests, and reporting results. The recommendations of this report will help SSA improve the consistency and accuracy of disability determination in certain cases.

Psychological Testing and Assessment Ronald Jay Cohen, 2022

Cognitively Diagnostic Assessment Paul D. Nichols, Susan F. Chipman, Robert L. Brennan, 2012-12-06 During the past two or three decades, research in cognitive science and psychology has yielded an improved understanding of the fundamental psychological nature of knowledge and cognitive skills that psychological testing attempts to measure. These theories have reached sufficient maturity, making it reasonable to look upon them to provide a sound theoretical foundation for assessment, particularly for the content of assessments. This fact, combined with much discontentedness over current testing practices, has inspired efforts to bring testing and cognitive theory together to create a new theoretical framework for psychological testing -- a framework developed for diagnosing learners' differences rather than for ranking learners based on their differences. This volume presents some initial accomplishments in the effort to bring testing and cognitive theory together. Contributors originate from both of the relevant research communities -- cognitive research and psychometric theory. Some represent collaborations between representatives of the two communities; others are efforts to reach out in the direction of the other community. Taking fundamentally different forms, psychometric test theory assumes that knowledge can be represented in terms of one or at most a few dimensions, whereas modern cognitive theory typically represents knowledge in networks -- either networks of conceptual relationships or the transition networks of production systems. Cognitively diagnostic assessment is a new enterprise and it is evident that many challenging problems remain to be addressed. Still, it is already possible to develop highly productive interactions between assessment and instruction in both automated tutoring systems and more conventional classrooms. The editors hope that the chapters presented here show how the reform of assessment can take a rigorous path.

Standardized Evaluation in Clinical Practice Michael B. First, 2008-05-20 In clinical settings clinicians continue to underutilize interviews and rating scales because their benefits are underappreciated and their use is perceived as too costly and time consuming. Augmenting the broad information contained in the APA's Handbook of Psychiatric Measures, this in-depth guide examines the real-world issues involved in implementing measures in actual clinical settings. This book asserts that the use of structured diagnostic interviews in clinical settings is justified, suggesting that it would be most cost-effective to target research assessment toward those groups most difficult to evaluate and most likely to be misdiagnosed, especially

those whose misdiagnosis leads to consumption of a greater-than-expected amount of treatment resources Focuses on the underrecognition and underreporting of diagnostic comorbidity, discussing the daunting practical issues of using comprehensive structured interviews and suggesting instead that a self-administered questionnaire be used to screen for the most common DSM-IV Axis I disorders Considers the use of structured interviews-administered by either lay interviewers or by computer-in the diagnostic assessment of children and adolescents, making a case that using the research model (i.e., reliable measures that can be given to large numbers of subjects) in clinical settings meets the cost-efficiency requirements of understaffed clinical providers Discusses the utility and limitations of research instruments for crucially important clinical purposes-determining suicide risk-and presents the inherent difficulties in predicting risk and explore the underlying clinical risk factors based on their proposed stress-diathesis model Presents the issues and challenges involved in the U.S. Department of Veteran's Affairs (VA) attempt to implement a national program requiring the routine use of the GAF scale. The authors conclude with a discussion of the reasons why the Global Assessment of Functioning (GAF) scale was chosen, software and procedures, methods to ensure system compliance, and the specific measures taken by two VA networks that helped improve its implementation It is a groundbreaking guide that details the pros and cons of using structured interviews and rating scales in clinical settings to ensure reliable and valid assessment of diagnoses, symptoms, and outcomes.

Personality Assessment in Treatment Planning James Butcher, Julia Perry, 2008-03-20 The establishment of frank and honest communication is one of the most important early goals of psychotherapy. Indeed, the most prominent challenge in the early stages of treatment is to develop a comfortable relationship that allows disclosure. In this volume, the authors show that objectively interpreted personality measures can be applied in psychotherapeutic assessments to facilitate an understanding of the patient and a thriving treatment program. Successful psychotherapy depends upon an early understanding of the patient's problems and personality and the establishment of attainable treatment goals. The extensive accumulated base of knowledge about personality and its maladjustment has become crucial when making treatment decisions about individuals in psychotherapy, and the field of personality assessment provides both methods and substantive information to support treatment-oriented evaluation. The MMPI has a long tradition of providing personality information about clients in mental health settings since the 1940s. James Butcher participated in the creation of the Minnesota Multiphasic Personality Inventory (MMPI-2) in 1989, which has continued to be one of the most commonly used personality tests in clinical evaluation. Over a thousand studies have been conducted on the effectiveness of the MMPI in treatment related assessments. Here, Butcher and co-author Julia Perry explore the MMPI-2 as well as a new assessment tool, the Butcher Treatment Planning Inventory (BTPI). In using psychological evaluation techniques for treatment planning, many clinicians incorporate information from a broad base of instruments-clinical interview, projective testing, behavioral data, and personal history-and do not rely on data from a single source. Therefore, while this volume focuses on the use of the

MMPI-2 and the BTPI in treatment planning, it will provide a context not to the exclusion of other measures.

Clinical Assessment of Child and Adolescent Personality and Behavior Paul J. Frick, Christopher T. Barry, Randy W. Kamphaus, 2020-06-11 The fourth edition of this textbook offers a scientific and practical context within which to understand and conduct clinical assessments of children's and adolescent's personality and behavior. The new edition ensures that the content is relevant to diagnostic criteria for major forms of child and adolescent psychopathology in the 5th edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5). It provides updated information on specific tests and discusses advances in research that have occurred since the last edition that are relevant for assessing the most common forms of psychopathology shown by children and adolescents. The volume is unique in providing both the scientific and ethical basis to guide psychological testing, as well as providing practical advice for using specific tests and assessing specific forms of psychopathology. This new edition: Highlights how current trends in psychological classification, such as the DSM-5 and the Research Domain Criteria, should influence the clinical assessment of children and adolescents. Provides updates to professional standards that should guide test users. Discusses practical considerations in planning and conducting clinical assessments. Evaluates the most recent editions of common tests used in the clinical assessment of child and adolescent personality and behavior. Provides an overview of how to screen for early signs of emotional and behavioral risk for mental problems in children and adolescents. Discusses practical methods for integrating assessment information collecting as part of a clinical assessment. Uses current research to guide clinical assessments of children with Attention-deficit/Hyperactivity Disorder, conduct problems, depression, anxiety, and autism spectrum disorder. Clinical Assessment of Child and Adolescent Personality and Behavior is a valuable updated resource for graduate students as well as veteran and beginning clinicians across disciplines, including school, clinical child, developmental, and educational psychology; psychiatry; counseling; and social work; as well as related disciplines that provide mental health and educational services to children and adolescents.

Self Psychology and Diagnostic Assessment Marshall L. Silverstein, 1999 The self psychology of Heinz Kohut has been an important force in contemporary psychoanalytic thought and its ramifications for therapy have been extensively explored. Now, Marshall Silverstein offers the first analysis of the application of self psychology to projective diagnostic assessment. Differentiating the self psychological approach from an ego psychological interpretation of classical drive theory, he clearly outlines the principal contributions of Kohut, including the concepts of selfobject functions, empathy, transmuting internalization, and compensatory structure. Providing numerous clinical examples, he shows how the major selfobject functions of mirroring, idealization, and twinship can be identified on projective tests. Silverstein then demonstrates how conventional assessment approaches to grandiosity, self-esteem, and idealization can be reconceptualized within the framework of self psychology, and he also contrasts ego psychological interpretations with self psychological interpretations. This book makes a strong case for the importance of the clinical identification of self states. It will help practitioners understand their patients' varied attempts to repair an injury to the self to restore self-esteem (compensatory structure) and the clinical consequences of self-disorders, including disintegration products such as narcissistic rage and affect states characterized by empty depression, chronic boredom, and lack of zest.

Handbook of Assessment in Childhood Psychopathology Cynthia L. Frame, Johnny L. Matson, 2013-11-21 One of the most important practical problems in child psychology and psychia try is the differential diagnosis of emotional disorders. Until recently, the gener al mode of assessment had been to apply to children the characteristics of psychopathology that were evident in adults. In addition, there had been few assessment tools available for use with children aside from modified versions of adult instruments. Understandably, this approach was controversial, and dissat isfaction with it led to the more recent knowledge that adult and child problems may be manifested quite differently. The third edition of the Diagnostic and Statistical Manual of Mental Disorders takes these factors into account much more extensively than previous editions. Furthermore, a great deal of research on methodology in child assessment procedures has emerged recently. Yet, in spite of these advances, practicing clinicians are still frequently at a loss in moving from the characteristics of the disturbed child before them to the final assign ment of a psychiatric diagnosis. The focus of this book is to outline the various methods of viewing and categorizing the wide range childhood psycho pathology, with special emphasis on the end product of making a

differential diagnosis. Our goal was to make this book unique in several ways. First, we attempted to cover a wider range of disorders than is typical in currently available hand books.

Play Diagnosis and Assessment Alice Sandgrund, Karen Gitlin-Weiner, Charles E. Schaefer, 2000-03-13 Through play children can express emotions that they cannot verbalise. This completely revised edition of a classic, field-leading resource explains to clinicians how best to identify children's problems using play therapy techniques.

Handbook of Infant, Toddler, and Preschool Mental Health Assessment Rebecca DelCarmen-Wiggins, Alice Carter, 2004-03-25 The Handbook of Infant, Toddler, and Preschool Mental Health Assessment brings together, for the first time, leading clinical researchers to provide empirically based recommendations for assessment of social-emotional and behavior problems and disorders in the earliest years. Each author presents state-of-the-art information on scientifically valid, developmentally based clinical assessments and makes recommendations based on the integration of developmental theory, empirical findings, and clinical experience. Though the field of mental health assessment in infants and young children lags behind work with older children and adults, recent scientific advances, including new measures and diagnostic approaches, have led to dramatic growth in the field. The editors of this exciting new work have assembled an extraordinary collection of chapters that thoroughly discuss the conceptualizations of dysfunction in infants and young children, current and new diagnostic criteria, and such specific disorders as sensory modulation dysfunction, sleep disorders, eating and feeding disorders, autistic spectrum disorders, anxiety disorders, posttraumatic stress disorder, and ADHD. Chapters further highlight the importance of incorporating contextual factors such as parent-child relationship functioning and cultural background into the assessment process to increase the validity of findings. Given the comprehensiveness of this groundbreaking volume in reviewing conceptual, methodological, and research advances on early identification, diagnosis, and clinical assessment of disorders in this young age group, it will be an ideal resource for teachers, researchers, and a wide variety of clinicians including child psychologists, child psychiatrists, early intervention providers, early special educators, social workers, family physicians, and pediatricians.
